7. Troubleshooting
8. Updating and uninstalling

1. What the module does

The **Shopeame** module connects your PrestaShop store with **shopea.me**, the service that brings the orders of your online store into your FacturaScripts ERP. Once the store is linked, every new or modified order is reported to shopea.me straight away, and shopea.me downloads it and creates it in the ERP, with no manual copying.

So that shopea.me can read the orders and keep the catalog, stock and prices up to date, the module enables the PrestaShop webservice and creates a key just for shopea.me, with only the permissions it needs.

- A **Shopeame** entry in the **Configure** menu of the PrestaShop back office.
- Two ways to link the store: copying its details into shopea.me, or entering the ERP UUID and token.
- Real-time order notifications when an order is created, changes status or is edited in the back office.
- Buttons to check the connection, unlink the store and delete the module data.
- Every notification is logged in **Advanced Parameters** → **Logs**.
- A failed notification never blocks the order: the customer still completes the purchase.

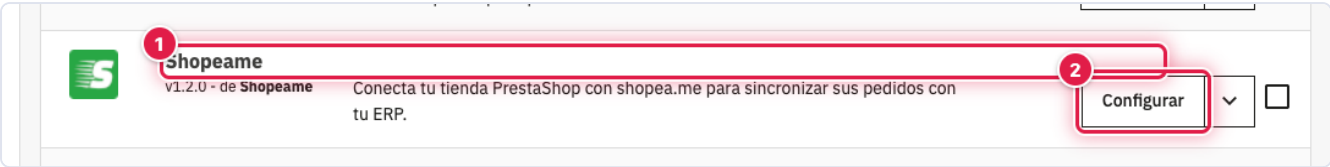

2. Requirements

- PrestaShop 9.0 or later and PHP 8.1 or later.
- The store served over HTTPS, on a server with outbound internet access.
- A **shopea.me** account with your ERP already registered.
- An employee with administrator permissions to install the module, because it enables the webservice and creates its key.

3. Installation

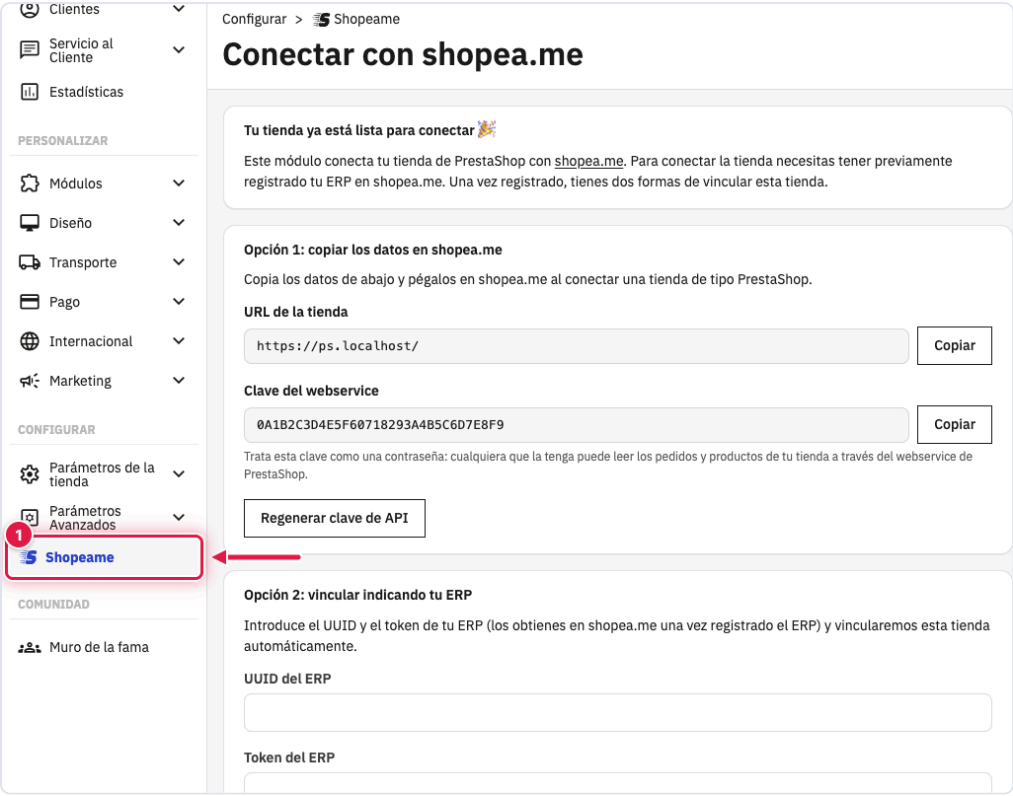

1. Go to **Modules** → **Module Manager**.
2. Click **Upload a module** and drop the zip file downloaded from PrestaShop Addons.
3. Wait for the message confirming that the module was installed.

The Module Manager now lists **Shopeame** (1) with a **Configure** button (2) that opens its page.

The Shopeame module in the Module Manager.

A **Shopeame** entry (1) also appears in the **Configure** section of the side menu. While the store is not linked, the **Connect with shopea.me** page shows **Your store is ready to connect** and the two ways to link it.

The Shopeame menu entry and the module page before linking the store.

4. Linking the store with shopea.me

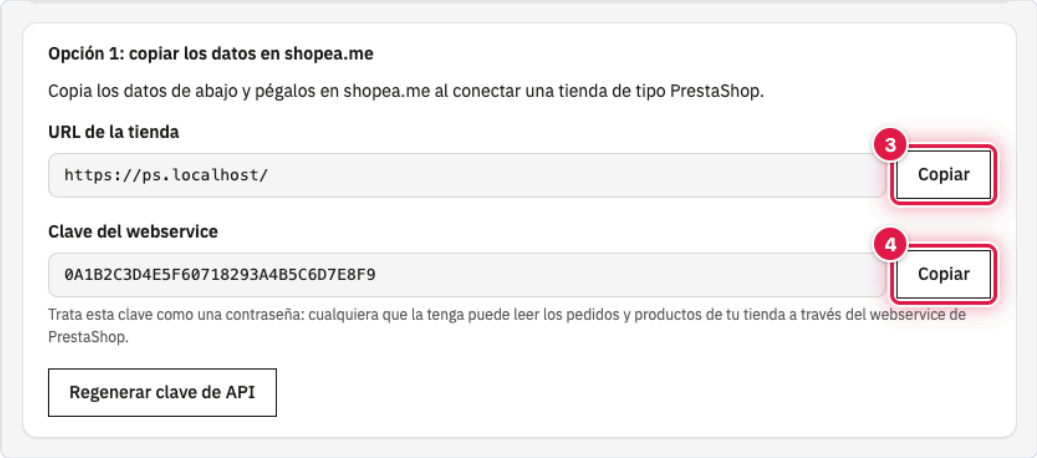

Choose one of the two options. Both end with the store created in your shopea.me ERP and the **Shopeame** page showing **Linked store**.

> The screenshots in this guide show the back office in Spanish. The labels quoted in the text are the ones you will see with the back office in English. The shopea.me screens may be shown in Spanish; their labels are given in English with the original text in brackets.

4.1 Option 1: copy the data into shopea.me

You generate the webservice key in PrestaShop and paste it into shopea.me together with the store URL. shopea.me checks that it can connect, creates the store and sends the linking data back to PrestaShop.

1. Go to **Configure** → **Shopeame**.
2. Under **Option 1: copy the data into shopea.me**, click **Generate API key**. The message **API key generated successfully.** appears and, if the webservice was disabled, the module enables it.
3. Click **Copy** next to **Store URL**.
4. Click **Copy** next to **Webservice key**.

The store URL and the webservice key, with their Copy buttons.

5. In shopea.me, open your ERP, go to the stores tab, click **Connect** (*Conectar*) under **Connect an online store or marketplace** (*Conectar una tienda online o marketplace*) and choose **PrestaShop**.
6. In **Step 2** (*Paso 2*), select **The module shows me the store URL and the webservice key** (*El módulo me muestra la URL de la tienda y la clave del webservice*).
7. Paste the store URL into **Store URL** (*Url de la tienda*).
8. Paste the key into **Webservice key** (*Clave de webservice*).
9. Click **Connect** (*Conectar*).

Step 2 of the shopea.me screen to connect a PrestaShop store.

> Treat the key like a password: it gives access to the orders, products and customers of the store. Do not delete it in **Advanced Parameters** → **Webservice**, or shopea.me will no longer be able to sync the store.

If, after connecting, the **Shopeame** page still shows both options, shopea.me could not send the data to PrestaShop (for example, because the store does not use HTTPS or a firewall blocks the request). Finish linking with option 2: the module recovers the store already created, without duplicating it.

4.2 Option 2: link using your ERP details

You copy your ERP UUID and token from shopea.me and paste them into PrestaShop. The module generates the webservice key if it does not exist yet and registers the store on shopea.me.

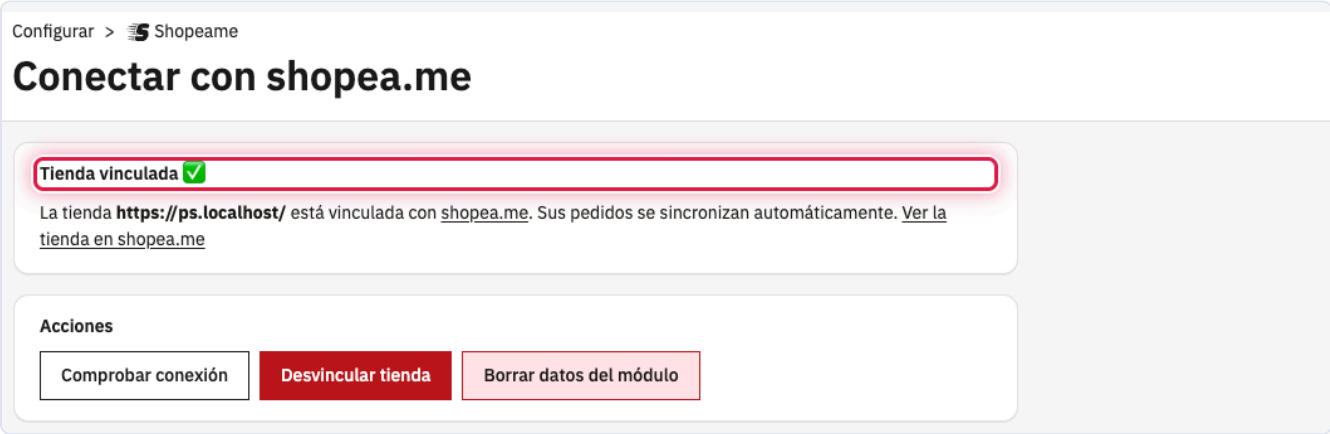

1. In shopea.me, open your ERP, go to the stores tab, click **Connect** (*Conectar*) under **Connect an online store or marketplace** and choose **PrestaShop**.
2. In **Step 2**, keep **The module asks me for an ERP UUID and token** (*El módulo me pide un UUID y un token del ERP*) selected.
3. Copy the **ERP UUID** (*UUID del ERP*) with its copy button.
4. Copy the **ERP token** (*Token del ERP*) with its copy button. Leave that page open.
5. In PrestaShop, go to **Configure** → **Shopeame**.
6. Under **Option 2: link using your ERP details**, paste the UUID into **ERP UUID**.
7. Paste the token into **ERP token**.
8. Click **Link store**.

The ERP UUID and ERP token fields and the Link store button.

The page shows **Linked store** with one of these messages:

- **Store linked with shopea.me successfully.**: the store was created in your ERP.
- **The store was already linked. Its data was recovered without creating a new store.**
- **The store was reactivated and linked with shopea.me successfully.**: it had been unlinked and comes back with its settings.

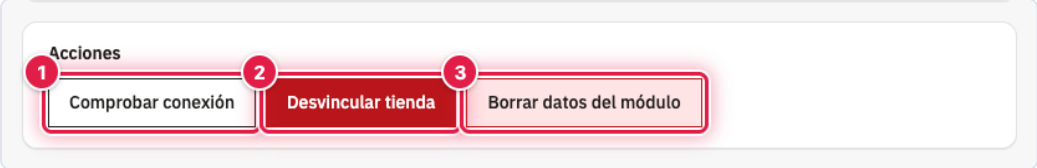

The Shopeame page with the store linked.

> The token gives access to your ERP on shopea.me: do not share it.

5. Managing the linked store

With the store linked, the **Actions** section of the **Shopeame** page has three buttons.

Check connection (1), Unlink store (2) and Delete module data (3).

Button	What it does
Check connection	Asks shopea.me whether it recognises the store. It answers **The connection with shopea.me is working correctly.** or **The connection with shopea.me could not be confirmed.**
Unlink store	Removes the store from shopea.me, stops syncing orders and deletes the linking data. The webservice key is kept so the store can be linked again.
Delete module data	Deletes only the linking data saved in PrestaShop, without notifying shopea.me or touching the key. Use it if you already unlinked or deleted the store on shopea.me, or if you restored a backup of the store.

While the store is not linked, option 1 shows **Regenerate API key**: it deletes the previous key and creates a new one. You then need to link the store again so that shopea.me receives the new key.

6. Data sent and permissions

- Before the store is linked, the module sends nothing.
- When linking: the store URL and the webservice key and, with option 2, the ERP UUID and token.
- For each new or modified order: only the order number. shopea.me reads the rest of the data through the webservice.

The webservice key created by the module only has these permissions, with no `DELETE` or `PATCH`:

Resources	Methods	Used for
`products`, `combinations`	GET, POST, PUT	Products, combinations and prices
`stock_availables`	GET, PUT	Stock
`categories`, `product_options`, `product_option_values`	GET, POST	Categories and attributes
`orders`, `order_states`, `customers`, `addresses`, `countries`, `states`, `currencies`, `languages`, `taxes`, `tax_rule_groups`	GET	Copying orders to the ERP
`configurations`	GET	Default language and time zone

The module does not modify core tables or other modules, and it downloads nothing after installation.

7. Troubleshooting

Message or symptom	What to do
The API key could not be generated. or **The API key permissions could not be set.**	Log in with an administrator employee and click **Generate API key** again. Check in **Advanced Parameters** → **Webservice** that the webservice is enabled.
The ERP UUID is not valid. or **The ERP token is not valid.**	The UUID has 13 characters and the token 32, letters and numbers only. Copy them again without spaces.
The store could not be linked: …	shopea.me does not accept the ERP details; the text that follows gives the reason.
Could not connect to shopea.me. Error: …	The store server cannot reach shopea.me. Check that it has internet access and try again.
Orders do not reach the ERP	Click **Check connection**, check on shopea.me that the store is active, and look in **Advanced Parameters** → **Logs** for messages starting with `Shopeame:`.

Every order notification leaves a log message:

- **Severity 1** (`event sent for order …`): the notification reached shopea.me.
- **Severity 2** (`shopea.me rejected the … event`): shopea.me rejected it. If it says `unauthorized` or `HTTP 401`, click **Delete module data** and link the store again.
- **Severity 3** (`could not be sent`): shopea.me could not be reached. The orders are picked up in the next sync.

8. Updating and uninstalling

Updates are installed from **Modules** → **Module Manager**, like any other module.

Uninstalling removes its configuration, the webservice key it created and the menu entry, and shopea.me no longer has access to the store.

For any question, contact us from the module page on PrestaShop Addons.
